AUTOSIM SENSOR SIMULATOR

By simulating output signals of most automotive sensors, AutoSim picks up service issues where a scan tool's diagnosis ends. Sensors tell the on-board computer when something is wrong. AutoSim helps determine if the cause is a faulty sensor, wiring or the ECU.

To check wiring - the device simulates the sensor voltages. Then simply check the live data readings on the scan tool to confirm the wiring. You can simulate most sensors from ABS to O₂ sensors. Eliminates need to replace non-defective sensors.

By the time you have avoided a couple of un-needed sensor replacements, the device has paid for itself!

- Voltage simulation range: 0.1V - 12V
- Frequency simulation range: 0.1Hz - 10KHz
- Trigger pulse output: up to 0.15 amperes maximum
- Output amplitude: 0.2V to 12V output amplitude can be selected at each mode
